

## General V4.4

---

### 1. SFDC+ Label Printing

Currently label printing via SFDC+ is enabled by adding SFDC+ to the customer's pin number. Even if label printing is not in use on site, if SFDC+ is on the pin, the label parameters need to be initialized to avoid messages being reported when various Swan programs are run.

The activation of label printing will now be controlled via a new parameter. This will allow the customer's pin to show SFDC+ without switching on the label printing.

The parameter will be added to the General Parameters, Options screen and will only be available if SFDC+ is on the user's pin. The valid setting for the parameter will be Y for label printing on and N for no label printing.

### 2. Quick Notepad Maintenance

Currently this program will only allow the user to enter a new or amend an existing document.

This processing will be changed to add a delete option. Selecting the delete option will allow the user to select a document (as per the amend option), view the first screen of comments and then confirm that they wish to delete the document. Deleting will permanently remove the document from the system.

This will apply to all document types.
